Pediatric Palliative Care in Uruguay: ADAPT Profile

- The Assessing Doctors' Attitudes on Palliative Treatment (ADAPT) study was conducted in 2020, in collaboration with local stakeholders.
- The study identified **physician** access, knowledge, and perceptions on palliative care integration **for children with cancer** as outlined by the World Health Organization (WHO) guide in 2018.
- The study received 874 physician responses from 17 countries (for published references, see p.2.).

PALLIATIVE CARE: defined by the WHO as the prevention and relief of patient suffering and the "ethical responsibility of health systems" that "should be integrated with and complement prevention, early diagnosis and treatment."

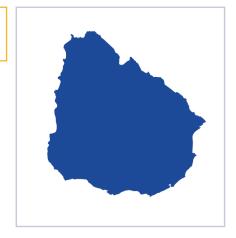

Palliative care improves treatment outcomes such as:

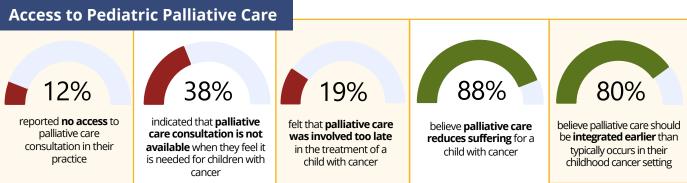

- Improved quality of life
- Better pain control and symptom management
- Decreased hospitalizations and fewer days in the intensive care unit

Palliative care integrated into health care systems at all levels and home care reduce health care costs by:

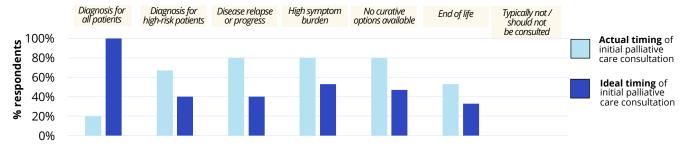

- Decreasing unnecessary resource utilization
- · Being less expensive
- Yielding better outcomes.

Additional information: Integrating Palliative Care and Symptom Relief Into Paediatrics: A WHO Guide for Health Care Planners, Implementers and Managers. WHO; 2018.

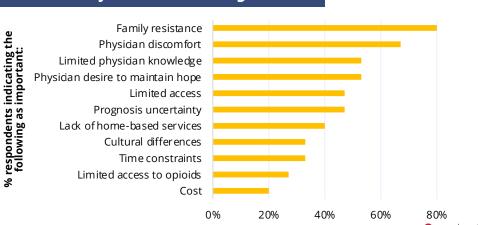

Barriers to Early Palliative Care Integration

Physicians in Uruguay indicated that family resistance, physician discomfort, and limited physician knowledge are the most significant barriers to palliative care consultation for children with cancer.

Physician Confidence in Delivering Palliative Care

13%

do not feel confident assessing and treating the physical needs of pediatric patients with serious incurable illness

do not feel confident providing grief and bereavement care to the families of children who die

felt uncomfortable addressing spiritual care needs

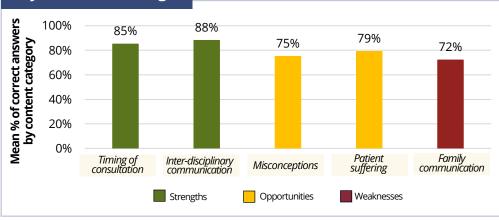

do not feel confident assessing and treating the emotional needs of pediatric patients with serious incurable illness and their families

0%

feel burdened by their inability to control the suffering of children at the end of life

Physician Knowledge

median score for palliative care knowledge in accordance with WHO guide

41% reported no previous palliative care education

wanted more education 100% on how to provide palliative care to their patients.

Strengths

High levels of access to palliative care consultation (88%)

Majority do not feel burdened by the inability to control suffering at the end of life (100%)

Strong desire among physicians for more palliative care education (100%)

Recommended Next Steps for Uruguay

Conduct further research to investigate the discrepancy between actual vs. ideal timing of palliative care consultation

Create interdisciplinary palliative care teams to meet the grief and bereavement needs of patients and families

Develop educational initiatives aimed at increasing community knowledge and acceptance of palliative care to minimize family resistance to palliative care involvement

Integrate palliative care education into medical school, residency, and fellowship curricula, focusing on improving communication with patients and families in pediatric cancer care

Regional Implementation of ADAPT in Uruguay

Country-adapted pediatric palliative care curriculum based on identified knowledge gap

Working with the Pan American Health Organization (PAHO) on their initiatives in palliative care
